

Teverra Case Study

Geothermal study for Ecopetrol

Ecopetrol wanted to better understand their geothermal resource and the best technology to use to produce this resource and utilized TEVERRRA's consulting services to provide answers and solutions.

TEVERRRA performed a geothermal resource assessment for Ecopetrol. The primary goal of this work was to characterize the subsurface thermal regime, quantify the thermal energy in place in the subsurface, and assess the geologic and economic risk to producing this energy using existing power system technology. The findings from this study were used to determine if Ecopetrol should progress with becoming a player in geothermal development and defined the best technology to use for their resource.
