

TEVERRRA Case Study

Geothermal feasibility study for the States of Alabama, Mississippi, and Georgia: Defining geothermal exploration targets in a nontraditional setting

TEVERRRA completed a comprehensive literature review and data review to highlight potential geothermal target regions within the southeastern United States for Southern Company. The primary goal of this work was to determine first order geothermal potential based on the existing geologic information. This work successfully defined the different types of geothermal resources that could be expected for the study region with respective depth ranges. Specific future exploration regions were highlighted from this play fairway analysis, which has led to an AOI specific study.
